

The Internet of Things refers to a network of physical devices, sensors, and embedded systems that connect and exchange data without human intervention. IoT devices measure temperature, humidity, motion, location, vibration, and other environmental parameters. These devices communicate using WiFi, Bluetooth, LoRaWAN, Zigbee, and cellular networks. IoT systems are used in smart homes, agriculture, healthcare, transportation, and industrial automation. Data collected from IoT sensors is processed through cloud or edge computing pipelines, enabling monitoring, prediction, and automation. This text supports RAG evaluation by offering structured information about IoT concepts, communication protocols, and real world use cases.
