

Natural Language Processing, or NLP, is a field of artificial intelligence that focuses on enabling machines to understand, interpret, generate, and interact with human language. It involves tasks such as tokenization, text classification, sentiment analysis, summarization, translation, and question answering. Modern NLP models use deep learning and transformer-based architectures to capture semantic meaning and contextual relationships across sentences. NLP applications include chatbots, virtual assistants, search engines, document analysis, and content moderation. This text serves as reference content for RAG testing, allowing retrieval models to extract definitions, concepts, and relationships within NLP workflows.
